Snow Plows for Wheel Loaders

Plow Contouring

The plow floats vertically and horizontally, contouring to the ground independently from the wheel loader.

The plow's horizontal oscillation has a spring centering system to keep the plow horizontal as it is lifted off the ground.

Wings

Hydraulically controlled wings rotate 180°. Each wing is equipped with an adjustable trip edge as well as an adjustable spring down force.

Wings have angle floating to contour to the ground as well as 6-1/2" of vertical travel. This enables the plow to be on the road surface and the wing on the sidewalk.

Trip Edge

- Sectional trip edges protect the plow from sudden impacts
- Adjustable spring tension

Adjustable Blade Force

Easily increase or decrease force of the blade with the press of a button. This function allows the blade to float and contour to the ground surface independent of the loader while maintaining consistent pressure on the blade. The operator can incrementally increase or decrease blade pressure based on the snow conditions.

Cutting Edge Options

- Standard AR Fixed Blade
- AR Sectional Floating Blade
- Poly Fixed Blade
- Poly Sectional Floating Blade
- Wing blades are Standard AR with Optional Poly

Universal Wireless Controls

Communicates with all Hydratach Attachments
Instantly switch from Plow to Broom to Snow Blower and more, all with one smart control system.

Joystick Controls

- Blade Angulation
- Individual Wing Adjustment
- Simultaneous Wing Adjustment
- Blade Downforce Adjustment (Optional)

HYDRATACH
Universal Attachment Solutions

Universal Wheel Loader Attachment System

High capacity attachments, that require the power unit, have a hydraulic quick coupler system to connect. This enables the power unit to be quickly utilized on various attachments, eliminating the need for each attachment to have its own power source.

The Hydratach system can control loader-direct attachments as well as high-capacity attachments through the power unit.

Single Carrier - Single Controller

The system will recognize the connected attachment. This means an operator can quickly go from a power unit attachment such as a snow blower to a loader direct attachment such as a wing plow or angle broom. The universal control and joystick will recognize and configure accordingly.
